The present invention describes a method (MI) for designing capture oligonucleotide probes (I) for use on a support to which complementary coligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detection infectious diseases caused by bacterial infectious agents (C) for detectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents or estected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC selected from Onchoverva volvulus, interacting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using e computer) identified ligation to a presence or absence of the target uncleotide sequences. Balls2074 to fereses the support and infrared microscope and incleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Cadida albicans and Aspergillus funigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents as elected from Onchoverava volvulus, Entemmeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probeset sets and correlating (using a computer) identified ligation to a presence or absence of the target uncleotide sequences. ABIRB2074 to a base of the target uncleotide sequences used in the exemplification

The present invention describes a method (MI) for designing deprute of conground-sociale probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents c.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigatuts, viruses e.g. T-cell lymphocytotrophis cirus, Estected from Onchoverva volvulus, Entamoeba histolycica and bracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC betecting cancer involving oncogenes, tumour suppressor genes or involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is superioration for environmental monitoring (using e.g. a scanning cand feed industry, detecting comprises scanning (using e.g. a scanning calcutulated and infrared microscope) the support at the electron microscope and infrared microscope) the support at the cancer sets sets of the target nucleotide sequences or absence of the target nucleotide sequences or absence of the target nucleotide sequences or absence of the target nucleotide sequences. Appression to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AB197546 represent oligonucleotide sequences used in the exemplification

 The invention relates to the restoration to and control of fertility in transforming rate with BT cytoplasmic male sterility. The invention involves transforming rate with a nucleic acid containing all or part of the fertility restorer gene (Rf-1) derived from rice cultivar IR24 (ACF30938), or a sequence at least 70% homologous to it which encodes a protein with similar activity. The Rf-1 gene is located on chromosome 10, and was analysed using RFUP (restriction fragment length polymorphism) and PCR to determine markers. The Rf-1 gene product is thought to be responsible for reducing the abnormal transcription of the mitochondrially-encoded atp6 gene which is thought to be responsible for cytoplasmic male sterility. The invention also encompasses a method of determining the presence of the Rf-1 gene in a rice genome, using suitable primers to amplify from the rice genome a marker consisting of the P4497 Mbo1-B56691 XbaI fragment of rice chromosome 10, and nucleic acids containing residues 3838-54123 or 42132-48883, and homologous sequences may be used to control and/or restore fertility in rice having BT cytoplasmic male sterility. Sequences ACF30912-ACF30929 and ACF30940-ACF30979.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                  Fragment of rice Rf-1 gene for restoration to and control of fertility in rice with BT male cytoplasmic sterility.

with RNA or DNA, comprising covalently-bound nucleosides that individually include a ribose of deoxyribose sugar portion and a base portion. The nuclease resistant compounds are useful as therapeutics, diagnostic agents, or research reagents. The compounds are also useful for modulating the activity of an RNA or DNA molecule, or for treating ar organism with a disease associated with the undesired production of a protein, e.g. bacterial, viral or protozona infections, AIDS, abnormal cell proliferation and tumour formation, or atherosclerosis. The present sequence represents the human c-raf mRNA antisense oligonucleotide #5
                                           The invention relates to a nuclease resistant compound that hybridises
                                                                                                                                                                                       Sequence 20 BP; 1 A; 10 C; 3 G; 6 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                           ö
The present invention relates to the isolation of novel human polypeptides referred to as NOVX (NOVI-NOV44), variants of these proteins, and the polymucleotide sequences encoding them. The NOVX proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for treating a syndrome related to a human disease associated with the polypeptides e.g. cancer. The present sequence represents a PCR primer used in a real time quantitative (RTQ) PCR reaction for DNA encoding a human NOVX protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nuclease resistant compounds, useful as therapeutics, diagnostic agents, or research reagents, or for treating an organism with a disease associated with the undesired production of a protein, e.g. bacterial infections or AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1. .20

The present interaction describes a compound (v) of our currecoper in the present interaction described encoding vascular endothelial growth factor receptor-1 (VEGFR-1), where the compound inhibits the expression of VEGFR-1 or with an 8-mucleobase portion of an active site on the nucleic acid molecule encoding VEGFR-1. Also described: (1) a composition of acid molecule encoding VEGFR-1. Also described: (1) a composition of comprising (C) and a carrier or diluent; (2) inhibiting the expression of VEGFR-1 in cells or tissues by contacting the cells or tissues with (C) or that the expression of VEGFR-1 is inhibited; and (3) treating an animal so that the expression of VEGFR-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, administering (C) to the animal so that the expression of VEGFR-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, cytostatic and antiinflammatcopy activities, and can be used in antisense compounds are used in antisense compounds compounds are used in antisense (e.g. cancer), rheumatoid arthritis, or diseases or conditions associated with the expression of VEGFR-1, such as hyperproliferative disorders (c) e.g. cancer), rheumatoid arthritis, or diseases or conditions involving anglogenesis. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, confitcing the temper for the entire members of a biological distinguishing between functions of various members of a biological prophylaxis, e.g. to prevent or delay infection.

Company The present sequence represents a human VEGFR-2 chimeric pathway. The present inventions
                                    present invention describes a compound (C) 8-50 nucleobases in length

the expression of condition New oligonucleotides which hybridizes to, and modulates the expr Jun N-terminal kinase, useful for treating a disease or conditio characterized by a reduction in apoptosis, e.g. prostate cancer, inflammation or fibrosis.

Example 4; Page 26; 69pp; English.

The invention relates to an oligonuclectide (antisense, AS) comprising 830 nuclectides connected by covalent linkages, where the oligonuclectide
30 nuclectides connected by covalent linkages, where the oligonuclectide
30 nuclectides specifically hybridisable with a nucleic acid encoding a
30 Jun N-terminal kinase (JNK) protein and modulates the expression of the
30 Jun N-terminal kinase (JNK) protein and modulates the expression of the AS oligonuclectide (or its bioequivalent, and a pharmaceutical
30 Treating an animal having/suspected of having/prone to having a
31 Carrier), treating an animal having/suspected of having/prone to having a
32 Carrier of the composition of the AS oligonuclectide),
33 Contacting the calls or tissues with the AS oligonuclectide, modulating
34 Contacting the calls or tissues with the AS oligonuclectide, modulating
35 Contacting the calls or tissues with the AS oligonuclectide, modulating
36 Contacting the calls or tissues with the AS oligonuclectide, modulating
37 Contacting the calls or the phosphorylation of a callular protein
38 Contacting the calls or the phosphorylation of a callular protein
39 Conduction and animal by administering the oligonuclectide to the calls of the conduction associated with a JNK protein or characterised by a reduction

```
The invention relates to an oligonucleotide (antisense, AS) comprising 8-
30 nucleotides connected by covalent linkages, where the oligonucleotide
30 nucleotides connected by covalent linkages, where the oligonucleotide
30 nucleotides geotifically hybridisable with a nucleic acid encoding a
30 Jun N-terminal kinase (JMK) protein and modulates the expression of the
30 oligonucleotide (or its bioequivalent, and a pharmaceutical
31 carrier) treating an animal having/suspected of having/prone to having a
32 carrier) treating an animal having/suspected of having/prone to having a
33 chyperproliferative disease (by administering to a prophylactic or
34 therapeutic amount of the composition of the AS oligonucleotide,
35 contacting the cells or tissues with the AS oligonucleotide, modulating
36 the cells or tissues with the AS oligonucleotide, modulating
37 the cell cycle progression (or the phosphorylation of a protein
38 contacting the cells or the phosphorylation of a protein
39 promotes one or more metaatatic events in cultured cells or the cells of
30 the growth of a tumour in an animal by administering the oligonucleotide to the cells, inhibiting
39 trowncleotide for JNK2 and treating a cell with an AS
30 condition associated with a JNK protein or characterised by a reduction
30 in apoptosis by administering a prophylactic or therapeutic amount of the
30 oligonucleotide. The animal subsection in apoptosis, such as
30 condition associated with a JNK protein or therapeutic amount of the
30 condition associated unmur, inflammation, fibrosis or condition (e.g. fibrotic scarring, peritoneal adhesions, lung
31 fibrosis or conduction (e.g. fibrotic scarring, peritoneal adhesions, lung
32 fibrosis or conduction (e.g. fibrotic scarring, peritoneal adhesions, lung
33 conduction, such as cancer. The antisense oligonucleotide may also be
34 cused as research agents and diagnostic aids, to detect the presence
35 conduction of one or more genes in the animal. The presence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotides which hybridizes to, and modulates the expression of Jun N-terminal Kinase, useful for treating a disease or condition characterized by a reduction in apoptosis, e.g. prostate cancer, inflammation or fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence is an antisense oligonucleotide targeting human JNK2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ouery Match 0.4%; Score 14.8; DB 1; Length 20; Best Local Similarity 88.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for producing transgenic livestock animal e.g. pig, by introducing nucleoprotein made of nucleic acid and recombinase into totipotent or pluripotent cell, and growing the resulting recombinant totipotent or pluripotent cell. The method is useful for producing transgenic livestock animal such as pigs, goats, sheep, cows or horses, preferably goats and pigs. The present sequence is a primer used for amplifying human lysozyme cDNA. This sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  congenital heart defect; prostate cancer; diabetes; metabolic disorder; neoplasm; graft versus host disease; AIDS; bronchial asthma; primer; crohn; a disease; multiple sclerosis; infectious disease; anorexia; cancer-associated cachexia; neurodegenerative disorder; RT-PCR; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia; wasting disorder; gene therapy;

The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence comprising one or more conservative NOVX or an amino acid sequence comprising one or more conservative proteins, determining the presence or amount of NOVX or NOVX DNA in a sample (by introducing the sample to an antibody that binds immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, determining the presence of or predisposition to a disease associated with altered levels of expression of NOVX or NOVX DNA in a first mammalian subject, identifying a spectation to a disease associated with altered levels of expression of NOVX or NOVX identifying a potential therapeutic agent the physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier KJ; Anderson DW, Vernet CAM, Catterton B, Miller CE, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CE, Gerlach VL, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, prostate cancer, diabetes, metabolic disorders, neoplasm, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious diseases, anorexia, cancerassociated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), immune disorders, haematopoietic disease or Parkinson's disease), immune disorders, haematopoietic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence is a reverse transcriptase (RT)-PCR primer used to assess the tissue specific expression of mRNA encoding a NOVX protein

Immunostimulatory nucleic acid #301.

25-SEP-2003 (first entry)

ACD99615;

```
The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX, an amino acid sequence which is at least 95% identical to NOVX or an order of Sequence comprising one or more conservative and sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX proteins, determining the presence or amount of Antibody bound to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, determining the presence of amount of antibody bound to the polypeptide, determining the presence of amount of antibody bound to the polypeptide, determining the presence of cor predisposition to a disease associated with altered levels of cor predisposition to a disease associated with altered levels of cor predisposition to a pathology related to aberrant expression of NOVX is dentifying a potential therapeutic agent to physiological interactions of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology secociated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and treating pathologies, diseases, conditions or disorders associated with chromic congenital heart defects, prostate cancer, diabetes, metabolic disorders, neoplasm, graft versus host disease, AlDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious diseases, anorexia, cancer. associated achexia, neurodegenerative disorders (associated with chromics diseases, Albse may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and detecting sequence is a reverse companied that forense to present experse to the present sequence is a reverse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptides and polynucleotides having properties related to estimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.
                                                                                                                                                                                Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ; Anderson DW, Vernet CAM, Catleaton E, Miller CE, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CE, Gerlach VL, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rochenberg ME, Larochelle WJ, Shinmets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for medulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ds; allergy; asthma; poly-G nucleic acid; aerosol formulation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                  New primordial human neural crest stem cell having a pluripotent and self -renewing properties, useful for implantation in vivo for cell therapy treatment of human neurological disorders and diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a primordial human neural crest stem cell line suitable for on-demand implantation in vivo into a living host subject comprising a pluripotent and self-renewing neural crest stem cell of human origin. The cell line is useful in the cell therapy treatment of human neurological disorders and diseases. The present sequence is a PCR primer used to isolate human genes from the HNC10 cell line
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense compounds, useful for modulating the expression of protein
kinase A (PKA) regulatory subunit RII alpha, and for treating a disease
or condition associated with expression of PKA regulatory subunit RII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PKA regulatory subunit RII alpha inhibitory oligonucleotide ISIS102773.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
The invention relates to a modified oligonuclectide comprising several covalently bound nucleosides including a ribose or decoxyribose sugar portion and a base portion. The nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides continued in the nucleosides includes a condition of the nucleosides includes a conditionance in maked base sequence. At least one of the nucleosides includes a conditionance of the invention are useful as therapeutics, diagnostics and research agents e.g. for the treatment of various viruses (e.g. AnDS), for modulating the production of proteins by an organism, treating an organism having a disease involving an undesired production of a protein (e.g. atherosclerosis, cancer), detecting the presence or absence of abnormal RNA molecules, or abnormal or inappropriate expression of normal RNA molecules in organisms or cells, and for the selective binding of RNA for use as research reagents and diagnostic agents. The compounds have improved stability to enzymatic degradation with various intracellular and extracellular nucleases, and improved ability to bind to a specific DNA or RNA with fidelity compared to wilder type DNA-DNA and RNA-DNA wild believed and phosphorus-addition of the propertice of the condition of condition of the condition of condition of the condition of conditions of the condition of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified oligonucleotides useful as therapeutics, diagnostics and research agents comprises several covalently bound nucleosides joined by internucleoside linkages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            duplexes containing methylphosphonates, phosphoramidates and phosphate triesters. The present sequence is an antisense oligonucleotide of the invention targeting human c-Raf.
                                                                                                                                                                                                                                                                                                                                                                          Human; 88; antisense; c-Raf; virucide; anti-HIV; antiarteriosclerotic;
                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; 2'-fluoro substituent; AIDS; atherosclerosis; cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

The invention relates to a novel method for amplifying a DNA using polymerase chain reaction (PCR) comprising synthesising the first region of a base sequence to be amplified by designing a pair of primers so to place the first region between them and to anneal each other at the 3'-end and carrying out a polymerase chain reaction (PCR) using the primers. Subsequently, the second region is synthesised by designing a pair of primers so as to place the second region partly overlapping with the first region of the base sequence between them and to anneal each other at the 3'-end and carrying out a PCR using the primers. Finally, the first region is annealed to the second region generating the template to carry out a PCR and thus to synthesize a base sequence containing the first and the second regions. The method of the invention may be useful for amplifying a DNA sequence. The current sequence is that of the DNA amplification-related PCR primer of the invention.

The present sequence is from the upstream regulatory region of the RET. regulates transcription. The sequence provides an example of intramolecular chair quadruplex Structure ADB86192 with 2 stable tetrads that regulates transcription. The sequence provides an example of intramolecular chair quadruplex DNA structures that have been identified as oncogene regulators. Certain mutations in quadruplex forming mucleotides sequences have been shown to destabilise quadruplex structure and are associated with cancer. Methods are provided for identifying quadruplex mucleotide sequences having destabilising guanine substitutions, for determining whether a subject is at risk of developing or having cancer, pharmacogenomic methods for targeting appropriate prevention or therapoutic regiments, methods for screening molecules that interact with stabilised and destabilised quadruplexes, and therapoutic methods for treating cancers, such as antisense mucleic acid cancer for the appropriate provention or prevention and settabilised and adstabilised quadruplexes, and therapout in the regorifically targets DNA in subjects having a quadruplex-
                                                                                                                                                                                                                                                                                                Identifying a compound that modulates the biological activity of a native quadruplex DNA for treating colorectal cancer comprises determining the presence or absence of interaction between the candidate compound and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; primer; human; PCR; WNT; chronic rheumatoid arthritis; WNT10B; rheumatoid arthritis; osteoarthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is from the upstream regulatory region of the HRAS gene. The sequence is involved in the regulation of transcription. It forms a quadruplex structure through the formation of guanine tetrads. The sequence provides an example of intramplecular chair quadruplex DNA structures that have been identified as oncogene regulators. Certain mutactions in quadruplex forming nucleotides sequences have been shown to destabilising quadruplex structure and are associated with cancer. Methods are provided for identifying quadruplex nucleotide sequences having destabilising guanine substitutions, for determining whether a subject is at risk of developing or having cancer, pharmacogenomic methods for targeting appropriate prevention or therapeutic regiments, methods for screening molecules that interact with stabilised and destabilised quadruplexes, and therapeutic methods for treating cancers, such as antisense nucleic acid cancer therapy that specifically targets DNA in subjects having a quadruplex-destabilising mutation.

Specifically, it refers to certain members of the VR family that are involved in pain perception, in particular, TRPV3 (previously known as VRLS, VRLX, VRLX, VR4 & TRPV3), TRPV4 (previously known as VRL3 & OTRPC4) and TRPM8 (previously known as TRPX). Furthermore, this invention includes trk4+ pain specific genes expressed in the sensory neurons of the dorsal root ganglia. Accordingly, such compositions can be useful for the diagnosis, treatment and prevention of pain, inflammation, skin disorders and cancer, and so exhibit analgesic,
disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiatrateriosclerotic properties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human c-raf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nouse; murine; PCR; ss; vanilloid receptor; VR; pain perception; TRPV3; VRLS; VRLX; VR4; TRPV7; TRPV4; VRL3; OTRPC4; TRPM8; TRPX; trkA+; inflammation; skin disorder; cancer; analgesic; antiinflammatory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acids and encoded proteins thereof. Specifically, it refers to certain members of the WR family that are involved in pain perception, in particular, TRPU3 (previously known as VRLS, VRLX, VR4 & TRPV3), TRPV4 (previously known as VRL) & OTRPC4) and TRPW3 (previously known as TRPX). Furthermore, this invention includes trKA+ pain specific genes expressed in the sensory neurons of the dorsal root ganglia. Accordingly, such compositions can be useful for the diagnosis, treatment and prevention of pain, inflammation, skin disorders and cancer, and so exhibit analgesic, antiinflammatory, dermatological and cytostatic activities. This colionucleotide sequence is a PCR primer used to amplify the murine TRPV3
oligonucleotide sequence is a PCR primer used to amplify the murine TRPV3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mouse; murine; PCR; ss; vanilloid receptor; VR; pain perception; TRPV3; VRLS; VRLX; VR4; TRPV7; TRPV4; VRL3; OTRPC4; TRPM8; TRPX; trkA+; inflammation; skin disorder; cancer; analgesic; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel vanilloid receptor (VR) related nucleic
                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated TRPV3, TRPV4 or TRPW8 vanilloid receptor nucleic acid molecule and polypeptides, useful for the diagnosis and treatment of disorders such as pain, inflammation, skin diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bevan

The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention curther relates to: an oligomucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in comparing the from any one of 1220 fully defined sequences as given in a microarray equipped with the SNP containing oligo. The isolated human contained invention is useful for detecting the single nucleotide plymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphism in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism cone of the invention.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation condon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of denosine of increasing levels of denosine of increasing levels of denosine or levels of denosine or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lung surfactant in a subject's tissue, or treating bronchoconstriction, uning inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ftp.wipo.int/pub/published_pct_sequences

The invention relates to a nuclease resistant mixture organization collections comprising at least one modified 2'-deoxyfuranosyl oligonucleotides comprising at least one modified 2'-deoxyfuranosyl group. The modified oligonucleotides are disclosed as being useful for modulating the production of a protein by an organism, and especially for treating a disease in an organism which is characterised by the undesired production of a protein. The oligonucleotides may be used to treat diseases caused by viruses or other agents. The oligonucleotides may also be used for diagnostic methods for detecting the presence or absence of abnormal RNA molecules in an organism or cell. Oligonucleotides of the normal RNA molecules in an organism or cell. Oligonucleotides of the invention that selectively bind RNA may also be useful as research reagents. The new oligonucleotides are nuclease resistant and hybridise to RNA or DNA targets with high strength and specificity. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nuclease resistant mixed sequence oligonucleotides useful as therapeutics, diagnostics, and research agents comprise at least one modified 2'-deoxyfuranosyl group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to RNA or DNA targets with high strength and specificity. The sequence represents a human c-raf antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 0.4%; Score 14.8; DB 1; Length 20; Best Local Similarity 88.9%; Pred. The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubjudinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an exceptor, producing bronchedilation, increasing levels of adenosine receptor, producing bronchedilation, increasing levels of adenosine receptor, producing bronchedilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating broncheconstriction, lung inflammation, lung allergies, or a respiratory disease or condition, note: The sequence data for this patent is not represented in the printed especialisation, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 muclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, invention and the invention and the invention and the invention and the composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of adenosine, receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed because of the patent is not represented in the printed or the patent is not represented in the printed or the patent is not represented in the printed or the patent is not represented in the printed or the patent is not represented in the printed or the patent is not the printed in the printed or the patent is not trepresented in the printed or the patent is not trepresented in the printed or the patent is not trepresented in the printed or the patent is not trepresented in the printed or the patent is not trepresented in the printed or the patent is not the presented in the printed or the patent is not trepresented in the printed or the patent is not the patent in the printed or the patent in the printed or the patent is not the patent in the printed or the patent in the printed or the patent in the printed or the patent in the patent in the patent in the patent in the patent 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating ailments associated with impaired

RESULT 1667

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction as pecond active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of composition in receptor, producing bronchodilation, increasing levels of adenosine or receptor, producing bronchodilation, increasing levels of biquinone or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                surfactant in a subject's tissue, or treating bronchoconstriction, inflammation, lung allergies, or a respiratory disease or condition: The sequence data for this patent is not represented in the printed iffication, but was obtained in electronic format directly from WIPO

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 3023; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 and genomic flanking regions, 5' and genomic flanking regions, 5' and genomic flanking regions, 6' and all intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mailgnant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing shorthaltation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung suffammation, lung allergies, or a respiratory disease or condition Note: The sequence data for this spatent is not represented in the printe specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (OIP-1) and zyxin-related protein-1 (OIP-1) and hitisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperproliferative disporders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as tresearch reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

                                                                                     셤
                                                                                                                                                                                                                                  The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (1) have anorectic, antidiabetic and cytostatic activities, and can be used in antisense therapy. (1) is useful for tracting an animal, particularly human, suspected of having an abnormal metabolic condition such is obesity,
                                                                                                                                                                                                Hormone-sensitive lipase; antisense oligonucleotide; inhibitor; obesity; phosphorothioate; antidiabetic; anorectic; cytostatic; antisense therapy; abnormal metabolic condition; hyperlipidaemia; type 2 diabetes; cancer; hyperproliferative disorder; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hyperlipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. pituitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose levels, particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase chimeric phosphorothicate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides targeted against nucleic acids encoding hormone-sensitive lipase, useful for treating abnormal metabolic condition, e.g. hyperlipidemia and obesity, or a hyperproliferative disorder, e.g. cancer.
                                                                                                                                                            Human HSL chimeric phosphorothioate oligonucleotide SEQ ID NO:132.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 20;

                                                                                                                                                                                                                                                AAD55037
                                                                                                                                                                                                                                                                             888888
                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. Is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemcherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, anglogenesis or neovascularisation (preferably ocular anglogenesis or neovascularisation). The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in
                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense oligonucleotide which is targeted to mRNA encoding human

Key enzymes include glutamate decarboxylase, gamma-aminobutyrate aminotransferase, gamma-hydroxybutyrate dehydrogense aminobutyrate aminotransferase. The invention is useful for producing tulipalin A or tuliposide A or its pathway intermediates such as alpha-methylenesuccinate semialdehyde, alphamethylene-gamma-aminobutyrate or alpha-methylene-gamma-hydroxybutyrate. Tulipalin A sequences are used to immunise animals to produce polyclonal or monoclonal antibodies with specificity for them or as targets to facilitate design and/or identification of inhibitors of those enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid fragment encoding a tuliposide A synthesizing protein, useful for creating recombinant organisms that have the ability to synthesize tulipalin A, tuliposide A or tuliposide A pathway
                                                                              Alpha-methylene-gamma-butyrolactone; glutamate decarboxylase; herbicide; enzyme; gamma-aminobutyrate aminotransferase; UDP-glucosyltransferase; gamma-hydroxybutyrate dehydrogenase; tulipalin A; plant; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence is a primer used

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating construction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cuffactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production congrises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoconstriction, allergies asthma, impeded respiration, respiratory cinflammation, allergies asthma, impeded respiration, respiratory clintammation, allergies asthma, impeded respiration, respiratory clintlammation, allergies asthma, impeded respiration, respiratory clintammation, emphysema, chronic observations pulmonary disease, pulmonary infections, bronchitis or cancer. Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; antalgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. t Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted uncleic acids associated with lung airway or lung dysfunction, and Aguilar D; Human calmodulin 2-derived oligonucleotide SEQ ID 3023 Katz E, Pabalan J, Claim 15; SEQ ID NO 3023; 763pp; English. ô
The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

Miller S,

Nyce JW,

oligonucleotide containing less percentage of adenosine, targeted t nucleic acids associated with lung airway or lung dysfunction, and Pharmaceutical composition for treating asthma, has antisense bronchodilating agent.

Claim 15; SEQ ID NO 3439; 763pp; English.

This invention describes a novel composition (a) a first active agent,

```
comprising oligonucleotides, effective for alleviating
bronchoconstriction, respiratory tract inflammation, allergies and
reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
surfactant depletion or hyposecretion, when administered to a mammal. The
oligonucleotides are derived from a gene encoding or regulating
expression of a target polypeptide associated with lung airway or lung
dysfunction or cancer and can be anti-sense to the corresponding mRNA.
The invention also describes a kit, that comprises: (a) a delivery
device, in separate containers, (b) the oligonucleotides, (c) the invention has antiallersy, antialmentory, antiasthmatic,
of the invention has antiallersy, and for use of the kit. The composition
of the invention has antiallersy, and containers of
the invention has antiallersy, and containers of
the invention has antiallersy and cytostatic activity, is a
beta-adrenergic agonist. The composition is useful for preventing or
treating a respiratory, lung or malignant disease. The administered
composition comprises oligo and is administered to reduce the production
or availability, or to increase the degradation of the target mRNA or to
reduce the amount of target polypeptide present in the lungs. The
pulmonary obstruction, and/or bronchoconstriction and/or lung
or inflammation, allergies and/or bronchoconstriction and/or lung
inflammation, allergies as thma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, allergic rhinits, pulmonary
transplantation rejection, pulmonary infections, bronchtis or cancer.
The reduced adenosine content of the anti-sense oligos corresponding to
thymidines present in the target RNA serves to prevent the breakdown of
the oligonucleotides into products that free adenosine into the system
e.g., lung, brain, heart, kidney, ecc, tissue environment and thereby, to
the oligonucleotides into product of it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

This invention describes a novel composition (a) a first active agent, comporising oligonuclectides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to increase the administered to reduce the amount of target polypeptide present in the lungs. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconstruction, inflammation, allergies, asthem, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emplysem, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                               Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                         Claim 15; SEQ ID NO 13904; 763pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   prevent any unwanted effects due to it

```
This invention describes a novel composition in a like active agent, comprising oligonucleotides, effective for alleviating critication, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, contractant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating contraction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antialergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a contraction a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactatin the prograduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactatin the present in the lungs. C distress syndrome, pain, cystic fibrosis, allergic rhintis, pulmonary contransplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligons corresponding to the continue present in the target RNA serves to prevent the breakdown of the charged adenosine content of the anti-sense oligons or cancer. The reduced adenosine content of the anti-sense oligons or cancer. The reduced adenosine content of the anti-sense oligons or cancer. The charge and content of the anti-sense oligons or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the oligonucleotides into products that free adenosine into the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                         to

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Whete agene.

To specifically priming and allowing amplification of each Whete agene.

To conclude the contract of seases and seases and seases.

To including autoinmune diseases, degenerative nervous system diseases.

To arrophic gastriitis. Degenerative nervous system diseases include multiple actoring and Alzheimer's disease. Hypersensitivity diseases include multiple sclenois and Alzheimer's disease. Hypersensitivities of a sonate. Hypersensitivities such as those present in Coodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV. fungal infections actored by viruses such as HOSP caused by cheevest infections caused by the yeast gaung Candida, parasitic infections such as those caused by shistosomes, filaria and bacterial infections such as those caused by shistosomes, filaria and bacterial infections such as those caused by shistosomes, filaria and bacterial infections such as those caused by contracterium. Neoplastic diseases include lymphoproliferative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The present invention relates to antisense compounds targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6 (GRK6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as rheumatoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from abbrrant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6, useful
for treating diabetes, drug addiction, uterine contractility and
                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to nucleic acids encoding a mammalian glucocorricoid receptor. The antiense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNR sequence represents an antisense oligonucleotide that targets the numan glucocorricoid receptor gene. NOTE: The present Boardence contains 2'-methoxyethyl (2'-NOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss;
                                                                                                                                      antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2-methoxyethyl; 2'-MOB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                  Human glucocorticoid receptor-specific antisense oligonucleotide #2069.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human glucocorticoid receptor-specific antisense oligonucleotide #2426.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNN sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabeces; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human glucocorticoid receptor-specific antisense oligonucleotide #3155.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

```

invention also relates to a method of identifying rice plants and seeds deficient in the Rf-1 gene using Rf-1 gene-related sequences; and a method for the regulation of Rf-1-mediated fertility recovery using Rf-1 gene antisense oligonucleotides. The method of the invention restores pollen fertility suppressed by BT cytoplasmic male sterility in rice, which is useful for seed production and for investigation of the mechanisms involved in sterility. Sequences ADI09991-ADI0998 and ADI09999-ADI10038 represent PCR primers used in an example from the invention in RFLP (restriction fragment length polymorphism) or PCR analysis of rice chromosome 10 to determine markers.

                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                        to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, present DNA sequence repersents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of restoring fertility to rice with BT cytoplasmic male sterility. The invention involves transforming rice with a nucleic acid encoding either the rice fertility restores protein Rf-1 ADI10045 or a protein at least 70% homologous to rice Rf-1. Specifically, the Rf-1 protein-encoding nucleic acids used in the method of the invention are ADI09997, ADI10039-ADI10043 or ADI10050-ADI10055. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rf-1 rice genomic sequences on chromosome 10 for fertility restoration to rice BT-type male sterility cytoplasm.
                                           New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                            The invention comprises an antisense oligonucleotides that are targeted

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human PPP3CB polypeptide and inhibits expression of the PPP3CB polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the PPP3CB polypeptide and in preparation of a composition for treating autoimmune disorders or Alzheimer's disease. This sequence represents an antisense oligonucleotide target region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding PPP3CB, useful for treating an autoimmune disorder,
                                                                                                                                                                                                                                                                    Human, PPP3CB; as; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; autoimmune disorder; Alzheimer's disease; immunosuppressive; nootropic; neuroprotective.
                                                                                                                                                                                                                                    Human PPP3CB DNA antisense oligonucleotide target region #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 4 A; 5 C; 9 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human PPP3CB polypeptide and inhibits expression of the PPP3CB polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the PPP3CB polypeptide and in preparation of a composition for treating autoimmune disorders or Alzheimer's disease. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding PPP3CB, useful for treating an autoimmune disorder,
                                                                                                                                                                                                                                                                                                                                                                    Human, PPP3CB; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; autoimmune disorder; Alzheimer's disease; immunosuppressive; nootropic; neuroprotective.

```

```
The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene (s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g.,

                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the cilgonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. Copen chosen from airway inflammation, allergy(ies), asthma, impeded copen airway inflammation, allergy(ies), asthma, impeded copen copen in the present sequence respiratory distress syndrome (COPD), allergic rhinitis (AR), acute respiratory distress syndrome coherunction. The present sequence represents an oligonucleotide of the invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention relates to an antisense oligonucleotide targeted to a nucleic acid encoding the human G protein-coupled receptor 6 (GPCR-6), which specifically hybridises with the nucleic acid encoding the GPCR-6 and inhibits expression of the GPCR-6. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the GPCR-6 and in preparation of a composition for treating a disease or condition associated with GPCR-6. e.g., a metabolic disorder, aberrant should associated with GPCR-6, a neuronal, motor, sensory, systhiatric or behavioural disorder or drug or chemical addiction. This sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound targeted to nucleic acids encoding G protein-coupled receptor 6 (GPCR-6), useful for treating animal having disease associated with GPCR-6 e.g. metabolic, neuronal, motor, sensory or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; G protein-coupled receptor 6; GPCR-6; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; metabolic disorder; aberrant signal transduction; Drain tissue; neuronal disorder; motor disorder; sensory disorder; psychiatric disorder; behavioural disorder; drug addiction; chemical addiction; neuroleptic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                              nucleic acid encoding the human G protein-coupled receptor 6 (GPCR-6), which specifically hybridises with the nucleic acid encoding the GPCR-6 and inhibits expression of the GPCR-6. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense oligonucleotides are useful for inhibiting expression of the GPCR-6 and in preparation of a composition for treating a disease or condition associated with GPCR-6, e.g., a metabolic disorder, aberrant signal transduction in brain tissue, a neuronal, motor, sensory, psychiatric or behavioural disorder or drug or chemical addiction. This sequence represents an antisense or drug oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic; endocrine; hepatoma-derived growth factor inhibitor; hepatoma-derived growth factor; metabolic disorder; hyperproliferative; human; 88; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

The invention describes a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding hepatoma-derived growth factor, and inhibits the expression of hepatoma-derived growth factor. The compound, composition and methods are useful for treating a disease or condition associated with hepatoma-derived growth factor, such as a metabolic disorder, or a hyperproliferative disorder, e.g. cancer, which is selected from hepatoma, leiomyoma, esophageal cancer or ovarian cancer. They are also useful in research and diagnostics for modulating the expression of hepatoma-derived growth factor. This sequence represents a human hepatoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic; endocrine; hepatoma-derived growth factor inhibitor; hepatoma-derived growth factor; metabolic disorder; hyperproliferative; human; ss; antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "OTHER= Phosphorothioate backbone. The present invention relates to antisense compounds, compositions and methods for modulating the expression of Centromere protein B. The compound, composition and methods are useful for treating diseases or conditions associated with Centromere protein B, such as hyperproliferative disorders (e.g. cancer), autoimmune disorders e.g. rhematoind arthritis, scleroderma, Raymaud's syndrome or systemic lupus erythematosus. The invention is also useful in gene therapy. The present sequence is human Centromere protein B antisense oligonucleotide used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                phosphorothioate; 2' MOE; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; all stone; triglyceridaemia; obesity; hepatitis; hepaticellular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiinflammatory; virucidal:
                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotide targeted to a nucleic acid encoding
Centromere protein B, useful for treating a disease, e.g. cancer,
rheumatoid arthritis, scleroderma, Raynaud's syndrome or systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense DNA oligo used to modulate human LRH1 expression SeqID 3016.

                                                                                                                                                                                                                                                                                                                                                                                                  to, and which specifically hybridises with a nucleic acid molecule encoding hepatoma-derived growth factor, and inhibits the expression of hepatoma-derived growth factor. The compound, composition and methods are useful for treating a disease or condition associated with hepatoma-derived growth factor, such as a metabolic disorder, or a hyperproliferative disorder, e.g. cancer, which is selected from hepatoma, leiomyoma, esophageal cancer or ovarian cancer. They are also useful in research and diagnostics for modulating the expression of hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor. This sequence represents a human hepatoma-derived growth factor antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Phosphorothioate backbone where all cytidines are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Centromere protein B; hyperproliferative disorder; cancer; autoimmune disorder; rheumatoid arthritis; scleroderma; Raynaud's syndrome; systemic lupus erythematosus; gene therapy; cytostatic; immunosuppressive; dermatological; antiinflammatory; human; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 nucleobases in length targeted

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants therefor Specifically, it refers to compositions 8-30 nucleobases in clength that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan unclear receptor protein that functions as a tissue specific or transcription factor. The present invention describes antisense transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MDE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MDE) and at least one modified succer, diagnosing a disease associated with LRH1, such as best cancer, dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit characteric, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antilipaemic, and virucidal activities. This cliconucleotide sequence is an antienness and or a condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NB5A2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific cranscription factor. The present invention describes antisense coligomucleotides that comprise at least one modified internucleoside linkage, a phosphorothicate linkage; at least one modified sugar moiety, a 2-0-methoxyethy1 (2' MDE) and at least one modified nucleobase, a 5-comethyquidine. These antisense compounds are useful for treating or diagnosing a disease associated with LRH1, such as breast cancer, dyslipidaemia, atherosclerosis, low HDL (high density lipoprotein), high continued acide acide or chronic triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with their anomates and continue exhibit the continued and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antiinflammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRHI protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the primary culture of adipocytes for gene therapy that stably carry a foreign secreted protein. Further disclosed is a method for producing the adipocytes, a transplant composition for gene therapy containing the cells, and a method for gene therapy and animals with the transplanted adipocytes. The proteins are preferably insulin or glucagon-like peptide 1. The cells of the invention are useful for gene therapy, particularly as a substitute for bone marrow cells or hepatocytes. The primarily cultured adipocytes are useful for ex vivo gene therapy. The current sequence represents a primer used in an example

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache, seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2 MOS wings and a deoxy age. Used during the antisense inhibition of thuman Navl.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; 88.

   The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate beadache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy, or ataxia. The present but not limited a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; NOVX; PCR; ss; G protein-coupled receptor; GPCR; cardiomyopathy; atherosclerosis; hypertension; congenital heart defect; aortic stenosis; atrial septal defect; ASD; atrioventricular canal defect; ductus arteriosus; pulmonary stenosis; subaortic stenosis; ventricular septal defect; VSD; tuberous sclerosis; scleroderma; obesity; adrenoleukodystrophy; congenital adrenal hyperplasia; prostate cancer; neoplasm; adenocarcinoma; lymphoma; uterine cancer; haemophilia;
                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding aball.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          related) polypeptides (designated NOVX) and the polypubleotides encoding them. The polypeptides and polypubleotides are useful as therapeutics in them manufacture of medicaments for treating syndromes associated with human diseases. The sequences are useful for treating a disorder associated with aberrant NOVX expression or activity such as cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, eartis septal septal defect (ASD), atrioventricular canal defect, ductus arteriosus, pulmonary stenosis, subsoctic stenosis, ventricular septal defect (VSD), tuberous sclerosis, scleroderma, obesity, adrenoleukodystrophy, congenital adrenal hyperplasia, prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer, neoplasm, adenocarcinoma, lymphoma, uterine cancer, haemophilia, hypercoagulability, idiopathic thrombocytopenia purpura, immunodeficiencies, graft-versus-host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, Albright's hereditary osteodystrophy, diabetes, infectious diseases, anorexia, nourodegenerative disorders, Albrightes's disease, Parkinson's disease, neurodegenerative disorders, Albrightes's disease, Parkinson's disease, immune disorders, haematopoietic disorders and metabolic disorders.                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method of producing a cDNA array on a support, which involves introducing a functional group to one edge part of 2 or more types of single stranded cDNA (known sequence) for fixing to a support and combining each strand of cDNAs with a support through a functional group for binding such that each strand of cDNA is mutually isolated and fixed. The method is useful for preparing a cDNA array, which is useful for detecting mismatches, or for identifying (for example) viruses or bacteriar The present sequence is that of a PCR primer which was used for amplification of a region of the human p53 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MOVX; antiarteriosclerotic; cytostatic; antidiabetic; antiparkinsonian; neuroprotective; nootropic; antiasthmatic; antiallergic; dimmunosuppressive; antiarthritic; antirheumatic; osteopathic; dermatological; antiinflammatory; anti-HIV; hypotensive; haemostatic; anorectic; gastrointestinal-den; antiuncer; antimicrobial; antipsoriatic; neuroleptic; antidepressant; anabolic; eating disorders-Gen; antidietrility; nephrotropic; gene therapy; antisense gene therapy; human disease; atherosclerosis; cancer; diabetes; Alzheimer's disease; Parkinson's disease; allergy; immune disease; graft-versus-host disease; osteoarthritis; rheumatoid arthritis;

This invention relates to novel human NOVX proteins and the DNA sequences which encode them. The invention may be useful for the development of compounds with an antiarteriosclerotic, cytostatic, antidiabetic, compounds with an antiarteriosclerotic, cytostatic, antidiabetic, compounds with an antiarteriosclerotic, cytostatic, antidiabetic, costeopathic, dermatological, antidifammatory, antidiathematic, costeopathic, dermatological, antidifammatory, antidepressave, antianthritic, antidicerility or nephrotropic activity. In addition, the sequences den, antidifertility or nephrotropic activity. In addition, the sequences of inclosed may be useful for gene therapy or antisense gene therapy. The NOVX polypeptides, nucleic acid and antibody are useful for manufacturing a medicament for treating a syndrome associated with a human disease. The NOVX polypeptides and polymucleotides are also useful for diagnosing, treating and preventing disorders associated with aberrant expression or aberrant physicological interactions of the polypeptide, for example of insease, asthma, allergies, immune disease, graft-versus-host disease, osteoparthritis, theumatoid arthritis, selected arthritis, selected arthritis, selected arthritis, infectious disease, parkinson's crivematosus, AIDS, hypertension, heamophilia, idiopathic cup a disease cupromatory burner, obesity, inflammatory bowel disease, contextissis, multiple selected with altered levels of the NOVX polypeptides and nucleic acid molecules or the nucleic control acid molecule or for screening for molecules that inhibit or enhance control selected with altered levels of the NoVX polypeptide or the nucleic control second molecules that inhibit or enhance control second molecules that inhibit or an edicine, or pharmacogenomics. The present sequence is that of a pcR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polypeptides (NOVX) and nucleic acid molecules, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. atherosclerosis, cancer, diabetes, Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example C; SEQ ID NO 133; 233pp; English.

New oligonucleotides, which specifically hybridizes with Jun N-terminal kinase protein, useful in diagnosing or treating inflammation, fibrosis or a fibrotic or hyperproliferative disease or condition. WPI; 2004-168941/16.

Claim 25; SEQ ID NO 31; 71pp; English.

The invention relates to an oligonucleotide comprising 8-30 nucleotides connected by covalent linkages, where the oligonucleotide has a sequence specifically typridisable with a nucleic acid encoding a Jun N-terminal kinase (JNK) protein and modulates the expression of the JNK protein. The invention also relates to a pharmaceutical composition comprising the cligonucleotide(s) or its bioequivalent and a pharmaceutical carrier, a method of treating an animal having, suspected of having or prone to having a hyperproliferative disease, a method of modulating the expression of a JNK protein in cells or tissues, a method of modulating cell cycle progression, phosphorylation of a protein that promotes one or JNK protein and expression of a cellular protein that promotes one or one metastatic events in cultured cells or the cells of an animal, a method of inducing apoptosis in a cell, a method of treating a mainal a cell, a method of treating a having a completion of treating an animal having a cumple of treating an animal having a condition associated with a JNK protein. The oligonucleotide and composition are useful in diagnosismy or treating a disease or condition characterised by a creduction in apoptosis (e.g. prostate cancer), a disease or condition associated disease or condition (e.g. scarring, peritoneal adhesions, lung fibrosis, conjunctival scarring) or a hyperproliferative disease or condition (e.g. cancer), or in inhibiting the growth of a tumour.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide comprising 8-30 nucleotides connected by covalent linkages, where the oligonucleotide has a sequence specifically hybridiashle with a nucleic acid encoding a Jun N-terminal kinase (JNK) protein and modulates the expression of the JNK protein. The invention also relates to a pharmaceutical composition comprising the oligonucleotide(8) or its bioequivalent and a pharmaceutical carrier, a method of treating an animal having, suspected of having or prone to having a hyperproliferative disease, a method of modulating the expression of a JNK protein in cells or tissues, a method of modulating cell cycle progression, phosphorylation of a protein phosphorylated by a compose more metastatic events in cultured cells or the cells of an animal, a method of inhibiting the growth of a tumour in an animal, a method of indivining the growth of a tumour in an animal, a method of indivinion characterised by a ceduction in apoptosis and a disease or condition characterised by a disease or condition associated
                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotides, which specifically hybridizes with Jun N-terminal kinase protein, useful in diagnosing or treating inflammation, fibrosis or a fibrotic or hyperproliferative disease or condition.
                                                                                                                                                                                                                                                             hyperproliferative disease; cell cycle progression; protein phosphorylation; tumour growth; cancer; apoptosis; prostate cancer; inflammation; fibrosis; fibrotic disease; scarring; peritoneal adhesion; lung fibrosis; conjunctival scarring; cytostatic;

The method is for analyzing probe supports or nucleic acids on nucleic acid chips with detection and quantitation of probe conditions and hybrid of probe with target nucleic acid, which is applicable in gene analysis, disease diagnosis and species identification. The present sequence represents a target sequence used
with a JNK protein. The oligonucleotide and composition are useful in diagnosing or treating a disease or condition characterised by a reduction in apoptosis (e.g. prostate cancer), a disease or condition associated with a JNK protein (e.g. inflammation, fibrosis), a fibrosis, disease or condition (e.g. scarring, peritoneal adhesions, lung fibrosis, conjunctival scarring) or a hyperproliferative disease or condition (e.g. cancer), or in inhibiting the growth of a tumour. This sequence represents a human JNK2 oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Analysis of probe supports or nucleic acids on nucleic acid chips by halogen-based time-of-flight secondary-ion mass spectrometry, applicable in gene analysis, disease diagnosis and species identification.

isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a PCR primer used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human NOVX polypeptides and polynucleotides. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to aga4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the mucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal natisense condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisinflammatory, neuroprotective, notoropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or condition associated with mpGES-1 expression of disease or condition associated with mpGES-1 expression of disease or condition associated with mpGES-1 inflammation, Alzheimer's disease, arthritis, diabetes, cancer, isolaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues, and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound, having a sequence targeted to a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, antiarthritic, vasotropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

New antisense compound, having a sequence targeted to a nucleic acid

```
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mEGES-1). The human meGES-1 gene is located on chromosome 9, more specifically too Gq44.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding meGES-1, which specifically hybridise with the nucleic acid meGES-1 and inhibits its expression; (2) a method of inhibiting the expression of meGES-1 in cells or tissues; and (3) a method of treating an animal condition associated with meGES-1. MPGES-1 chimeric antidabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound con be used as mPGES-1 inhibitors and in gene therapy. The antisense compound con the used as mPGES-1 inhibitors and in gene therapy. The antisense compound contion associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation alsorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGBS-1; mPGBS-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic, antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

antidiabetic, immunomodulator, cardiant, neuroprotective, antiantlammatory, neuroprotective, nootropic, antianthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGBS-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGBS-1 e.g., inflammation, Altheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8.30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding
                                                                                                                                                                                                                                                                                                                                                 New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically. The human mpGES-1 gene is located on chromosome 9, more specifically to mpGES-1. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, and antisense compounds have cytostatic, antidiabetic, immunomodulatory and cardiant activities, and can ophthalmological, immunomodulatory and cardiavascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

(PHAA) PHARMACIA CORP

Gierse JK;

New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or ischemia.

Claim 4; SEQ ID NO 1219; 132pp; English.

antidiabetic, immunomodulator, cardiant, neuroprotective, antiantlammatory, neuroprotective, nootropic, antianthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated whith mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder. encoding The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9034.3. The present invention also describes: (1) antisense compounds having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,

encoding mPGES-1, useful for preparing a composition for treating e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

New antisense compound, having

WPI; 2004-305094/28.

a sequence targeted to a nucleic acid

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to

Claim 4; SEQ ID NO 1597; 132pp; English.

9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8.30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. WFGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, antinflammatory, neuroprotective, nootropic, aphthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's

The invention relates to oligonuclectides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin [L1]-4 receptor, interleukin [L1] chosen from a gene encoding interleukin [L1]-4 receptor, interleukin [L1] chosen from a gene encoding interleukin [L1]-4 receptor, interleukin [L1] chosen from a gene encoding interleukin [L2]-4 receptor, interleukin [L1] con encoding arget(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The prevention and/or treatment of a respiratory or lung disease. The colligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, ppB4 B, ppB4 C, or ppB4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with cifinamation or an inflammation, allergy, asthma, impeded respiration, allergy, asthma, impeded respiration, cycle ithrosis (CP), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory disease (COPD), allergic rhinitis, acute respiratory disease syndrome, pulmonary hypertension, lung inflammation, represents an oligonucleotide of the bronch constriction. This sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Ectaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 B; PDE8 C; PDE8 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; CODP; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertenaton; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

The invention relates to antisense oligonuclectides targeted to a nucleic acid molecule encoding fatty acid synthase, which inhibit the expression of fatty acid synthase. The antisense oligonuclectides are useful for increasing the metabolic rate, decreasing adiposity, decreasing serum leptin, decreasing serum cholesterol, decreasing blood glucose, decreasing serum insulin, decreasing serum lipids and treating an animal having a disease or condition associated with fatty acid synthase, such as breast, prostate, colon, endometrium, ovary and thyroid cancers. It may also be useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human fatty acid synthase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New compound of 8-80 nucleobases in length which inhibits the expression of fatty acid synthase, useful for treating disease or condition associated with fatty acid synthase such as breast and colon cancers.
                                                                                                              /mod_base= Other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EXEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 mucleotides of the 5'-end or 3'-end of a mucleic acid farger chosen from a gene encoding interleukin (IL) -4 receptor, interleukin (IL) -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 A, PDB4 B, PDB4 C or PDB4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, EDE4 A, PDB4 B, PDB4 C, or PDB4 D. The oligonucleotides are useful for reducing or inhibiting expression of a complication or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine and/or asthma and/or lung allergies associated with materion or an inflammatory disease. The respiratory or lung disease is associated with hyper-respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), hypertension, lung inflammation, allergy, asthma, impeded respiration, hypertension, lung inflammation, bonchitis, airway obstruction or the bronchitis, airway obstruction or the propertion or an inflammation, allergy as an oligonucleotide of the bronchitis and or the sequence represents an oligonucleotide of the bronchitis and or the propertion or the propertion or the propertion or the propertion or an inflammation, allergy and propertion or the propertion of the propertion or an inflammation, and propertion or an inflammation or an inflammatio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                     Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; fatty acid synthase; antisense therapy; metabolic rate; adiposity; serum leptin; serum cholesterol; blood glucose; serum insulin; serum lipid; breast cancer; prostate cancer; colon cancer; endometrium cancer; ovary cancer; thyroid cancer; infection; inflammation; tumour; probe; human.

The antisense oligonucleotides are useful for increasing the metabolic rate, decreasing adiposity, decreasing serum leptin, decreasing serum cholesterol, decreasing blood glucose, decreasing serum insulin, decreasing serum lipids and treating an animal having a disease or condition associated with fatty acid synthase, such as breast, prostate, colon, endometrium, ovary and thyroid cancers. It may also be useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human fatty acid synthase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                         New compound of 8-80 nucleobases in length which inhibits the expression of fatty acid synthase, useful for treating disease or condition associated with fatty acid synthase such as breast and colon cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The invention relates to screening for therapeutic agents and involves contacting a test compound with a G-protein coupled receptor 6 (GPR6) contacting a test compound with a G-protein coupled receptor 6 (GPR6) polypeptide, and detecting blinding of the test compound to GFR6 as a compound concentration (or in the absence of the test compound or at the presence of a compound known to be a GFR6 polypeptide activity at a certain test compound known to be a GFR6 polypeptide regulator. The therapeutic agents are useful in treating disease such as hematological disorders of the peripheral and central nervous system, urological disorders of the peripheral and central nervous system, urological disorders of the peripheral and central nervous composition for treating disease such as hematological disorders, leukopenia, leukaemia, and lymphomas), cardiovascular disease (e.g., heart failure, myocardial infarction, ischemia, arkiythmias, atherosclerosis, and hypertensive vascular disease), disorders of the peripheral and central nervous system (e.g., Parkinson's disease, compaction, lupus nephritis, glomerulopathies, nephritis, computed is allored in disease, stroke, Alzheimer's disease, eleg., renal central nervous system (e.g., Parkinson's disease, contropical disorders (e.g., dysphagia, Barrett's metaplasia, creation conjunctivitis, and erectile dysfunction), carcerating, islet cropluctivitis, atrophy of gastric glands, gastric ulcers, chronic gastroenterological disorders (e.g., dysphagia, Barrett's metaplasia, chromic stress gastritis, atrophy of gastric glands, gastric disease, and conjunctivitis, hereditary angloedema, Hashimoto's thyroiditis, systemic lupus erythematosus and scleroderma, and central for children conjunctivitis, hereditary angloedema, Hashimoto's children conjunctivitis, hereditary angloedema, Hashimoto's amammal they are also useful for the regulation of GRBC crivity in a mammal to the mammal having the disease. The GRBC activity the present
                                                                                                                                                                                                                                                                                                                     Screening for therapeutic agents, useful for treating e.g. hematological diseases, comprises contacting a test compound with a G-protein coupled receptor 6 polypeptide and detecting binding of the test compound to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence represents a probe hybridising to the human GPR6 receptor cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to antisense compounds targeted to a mucleic acid encoding human Gankyrin. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of Gankyrin. The antisense oligonucleotide comprises at least one modified. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety, the antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcycosine. The antisense oligonucleotide further comprises at least one modified nucleobase, useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                           New compound targeted to a nucleic acid molecule encoding Gankyrin and inhibits the expression of Gankyrin, useful for modulating the expression of Gankyrin or for diagnosing or treating, e.g. hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hyperproliferative disorders, e.g. cancer. The present sequence represents a human Gankyrin DNA target sequence for an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 14.8; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antisense compounds targeted to a nucleic acid encoding human Gankyrin. The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of Gankyrin. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOB) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises such as hyperproliferative disorders, e.g. cancer. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound targeted to a nucleic acid molecule encoding Gankyrin and inhibits the expression of Gankyrin, useful for modulating the expression of Gankyrin or for diagnosing or treating, e.g. hyperproliferative

                                                                                                                                                                                                                                                                                                                                                                   The invention describes a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding inhibitors of apoptosis (IAP) like, where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the expression of IAP-like and calls or tissues; screening for a modulator of IAP-like; a diagnostic method for identifying a disease state comprising in IAP-like; a call of IAP-like in a sample using at least one of the primers the presence of IAP-like in a sample using at least one of the primers of sequences comprising SEQ ID NO. 5 or 6, or the probect of comprising SEQ ID NO. 7; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like.

It is also useful for diagnosting or treating diseases associated with Corporation of IAP-like, e.g. a hyperproliferative disease. This sequence represents a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                 New compound targeted to a nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like and inhibits expression of IAP-like, useful for modulating the expression of IAP-like or for treating, e.g. hyperproliferative disorder.

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition. They are also useful in research and disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence respressors a chimeric phosphorothicate oligonuclectide with 2' MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
(GFAI), for treating diabetes, a cardiovascular or neurologic disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/repertusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GFAT; Antidiabetic; Cardiant;
